                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     RNeasy protocol (Qiagen). Purified RNA was isolated using the rounds of digestion with RNase-free DNase I (Promega).

DNase I was heat-inactivated at 75cC for 5 min. and removed by using RNeasy columns followed by phenol extraction and ethanol precipitation. The RNA preparations were confirmed to be free of genomic DNA contamination by carrying out PCR and RT-PCR using the Access kit (Promega) and primers specific for the histone-like protein gene hip (Lee et al., 1998). cDNA as synthesized using random hexamer primers (Promega) and Stratagene's cDNA synthesis kit. cDNA fragments were ligated into lambda ZAP II vector and packaged in vitro using Stratagene reagents.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        08
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         //note="Vector: pBluescript II SK-; Site_1: EcoRI; Site_2: XhoI; Stress condition II library, constructed by John Davies and Jeffrey McDermott, combines cDNAs from CC-1690 cells grown to mid-log phase in TAP (NH4+ containing) and shifted to TAP - NO3- (24hrs); H2 production conditions (0, 12hr, 24hr) see Melis et al., (2000) Plant Phys. 122: 127-135; TAP + H2O2 (1, 12, 24 hr); TAP + Sorbitol (1, 2, 6, 24 hr); TAP + Cd (1, 2, 6, 24 hr). PolyA mRNA was purified from each sample, pooled and cDNA synthesized. The cDNA was directionally cloned into lambda ZaP II (Stratagene) in the EcoRI (5') and XhoRI (3') sites. pBluescript II SK- plasmids were excised from the lambda ZAP clones by superinfection with ExAssist (Stratagene) phage. The library was normalized using method 4 described in Bonaldo et al., (1996) Genome Research 6: 791-806."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                world. Half of the world population especially those inhabiting highly populated areas of the humid tropics and subtropics, rely on rice as their primary source of carbohydrate. Moncotyledonous rice is a diploid plant (2n=24) with a haploid genome equivalent of 431 Mbp (Arumuganathan and Earle, 1991). The relatively small genome of rice, three times larger than that of Arabidopsis, makes it suitable for genomic studies. In order to facilitate positional cloning, physical mapping and genome sequencing of rice, we have constructed a BAC library from Oryza sativa, Nipponbare variety. The library contains 36,864 clones with an average insert size of 128.5 Kb providing 10.9 haploid genome equivalents. The deep coverage allows the isolation a particular sequence with a probability of 99.8. Two high density filters, each containing 18,432 clones (doubly spotted), represent the whole library for colony screening."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       107

plants grown to full tillering stage were treated with 150
mM NaCl for either 12 hours or 7 days. Root tissues of the
plants subjected to both types of treatment were collected
separately at University of California, Davis (E. Akhunov
and K. Deal in J. Dvorak's Lab). Total RNA was prepared
separately from the two samples (12h and 7day treatments),
and equal amount of RNA was then pooled PolyA RNA was
purified from the pooled RNA, a cDNA library was made, and
the cDNA clones were in vivo excised to give pBluescript
SK(-) phagemids in J. Dvorak's lab (E. Akhunov, J. Dvorak)
at the University of California, Davis. Colony plating,
plasmid DNA preparations and DNA sequencing were performed
in the OD Anderson lab (all other authors)."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              92

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               83
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            mid-log phase in TAP (acetate-containing) medium in the light TAP medium in the dark, HS (minimal) medium in ambient levels of CO2 and HS medium bubbled with 5% CO2. PolyA mRNA was purified from each sample, pooled and cDNA synthesized. The cDNA was directionally cloned into lambda ZAP II (Stratagene) in the EcoRI (5') and XhOI (3') sites. pBluescript II SK- plasmids were excised from the lambda ZAP clones by superinfection with ExAssist (Stratagene) phage. The library was normalized using method 4 described in Bonaldo et al (1996) Genome Research 6: 791-806."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         NC 27708-1000
                mid-log phase in TAP (acetate containing) medium in the light, TAP medium in the dark, HS (minimal) medium in ambient levels of CO2 and HS medium bubbled with 5% CO2 POLYA mRNA was purified from each sample, pooled and cDNA synthesized. The cDNA was directionally cloned into lambda ZAP II (Stratagene) in the EcoRI (5') and XhoI (3') sites. PBluescript II SK plasmids were excised from the lambda ZAP clones by superinfection with ExAssist (Stratagene)

The BDGP is constructing a physical map of the Drosophila melanogaster genome using these BACs. For further information please see http://www.fruitfly.org The BDGP Drosophila please see http://www.fruitfly.org The BDGP Drosophila melanogaster BAC library was prepared by Kazutoyo Osoegawa and Adron Mammoser in Pieter de Jong's laboratory in the Department of Cancer Genetics at the Roswell Park Cancer Institute in Buffalo, NY. The library is named RPCI-98 and was constructed by partial Ecognic strain y2; cn bw sp, the same strain used for the BDGP's pl and EST libraries. A more detailed description of the library and how to order individual BAC clones, the entire library, or filters for hybridization from the BACPAC Resource Center can be Location/Qualifiers

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         /note-"vector: lambdaZAP; Site_1: EcoR1; Site_2: Xhol; plants were raised from seeds in a Controlled Environments growth chamber maintained in continuous light at 18oC, and testa and pericarp were dissected from developing kernels at Washington State University, Pullman, WA (Kannangara, von Wetstein). Total RNA was prepared, poly(A) RNA was purified, one cDNA library was made, and 1 million pfu were in vivo excised to give pBluescript SK(-) cDNA phagemids in the TJ Close lab at the University of California, Riverside (Akhunov, Chin, Choi, Close, Fenton, Kianian, Otto, Simons, Zhang). Phagemids were plated and picked at the Clemson University Genomics Institute (CUGI)

                                                                                                                                                                                                                                                                                                                                (Begum, Palmer, Frisch, Atkins and Wing). Plasmid DNA preparations, DNA sequencing and sequence analysis were performed at CUGI (Wing, Yu, Frisch, Henry, Simmons, Oates, Rambo, Main). The sequence has been trimmed to remove vector sequence and contains a minimum of 100 bases of phred value 20 or above. For more details on library preparation and sequence analysis see
                                                                                                                                                                                                                                                                           http://www.genome.clemson.edu/projects/barley. Sequences have been trimmed to exclude PolyA, vector, and regions
below Phred quality 16. The threshold for highest quality sequence
is 20. Three-prime sequences, which are obtained with PolyTMix or
T7 sequencing primer, are presented as the reverse complement.

Colletotrichum graminicola"

(notes Vector: pBluescript II SK(-) from Lambda Zap II;

Site_1: XhoI; Site_2: EcoRI; Four-week-old sorghum

seedlings were sprayed with spore suspension prepared from

3-week-old FRM42I, a sorghum isolate of the anthracnose

pathogen Colletotrichum graminicola. Inoculated plants

were kept in a 25 C dark growth chamber with 100% relative

The column eluent was then precipitated, redissolved, and ligated into Stratagene's pBluescript II XR predigested vector (pBluescript II SK(+) vector that has been digested with EcoRI and XhoI, and phosphorylated by Stratagene). 100% of the white and 87.5% of the blue colonies appear to contain recombinant plasmids with cDNA inserts, based on size (n=28 and 8 respectively). This library was constructed by Dr. Paul Keim and Dr. Virginia Coryell."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              humidity for 24 hr, followed by 12/12 hr of light/dark cycle at 25 C with 90% relative humidity for another 24 hr. All leaves were harvested and quick frozen with liquid nitrogen and stored in a -80 C freezer. The library was made from poly-A RNA in the cloning vector lambda ZAP II. Clones to be sequenced were prepared by mass excision. WARNING: While most or all ESTs are expected to derive from the host plant, no effort was made to eliminate ESTs deriving from the pathogen."

Sequence 1, Application US/09934778
Patent No. US20020106772A1

```
APPLICANT: Wang, X.

APPLICANT: Cooper, Bret

TITLE OF INVENTION: Promotters for regulation of plant expression

FILE REFERENCE: 1360.001US1

CURRENT APPLICATION NUMBER: US/09/887,576

CURRENT FILING DATE: 2001-06-25

PRIOR APPLICATION NUMBER: US 60/213,848

PRIOR FILING DATE: 2000-06-23

PRIOR APPLICATION NUMBER: US 60/214,087

PRIOR APPLICATION NUMBER: US 60/214,087

PRIOR FILING DATE: 2000-06-23

PRIOR FILING DATE: 2000-12-29

PRIOR FILING DATE: 2000-12-29

These rpoB gene fragments can be used in the diagnosis and identification of Mycobacterium species using a cc method. The method comprises obtaining a restriction fragment length polymorphism analysis (pRA) cc method. The method comprises obtaining a restriction fragment length cc amplifying and digesting the DNA fragment from the microorganism to comprise with the unidentified fragment from the microorganism to be identified and comparing the RFIP patterns from the known rpoB gene cc are useful to identify a wide range of Mycobacterium species, e.g. for cd diagnosis or to obtain epidemiological and pathogenesis information for can non-tuberculous mycobacteria (NTM) encountered in subjects infected with human immunodeficiency virus (HIV). Analysis of the rpoB gene cc with human immunodeficiency virus (HIV). Analysis of the rpoB gene cc experiment; including those difficult to distinguish by usual blochemical cc tests. Also described are oligonucleotide probes (AASO5227-AASO5242) for xx

XX New DNA fragments from the rpoB gene of mycobacteria, useful for production of many mycobacterial species by restriction fragment length polymorphism.

CC Production fragment length polymorphism.

CC Production fragment length polymorphism.

CC Production fragment length polymorphism.

CC Crayment is 1 of 24 rpoB gene fragments (AASO5201-AASO5224) from CC fragment is 1 of 24 rpoB gene fragments (AASO5201-AASO5224) from CC fragment is 1 of 24 rpoB gene fragments (AASO5201-AASO5224) from CC fragment for production of mycobacteriam species using a cc method. The method comprises obtaining a restriction fragment length polymorphism analysis (PRA) CC polymorphism (RFLP) pattern of the 24 rpoB gene fragments; isolating, CC amplifying and digesting the DNA fragment from the microorganism to CC are useful to identify a wide range of Mycobacterium species, e.g. for celection of appropriate therapies, including M. tuberculosis, M. leprae CC and non-tuberculous mycobacteria (NFM) encountered in subjects infected fragments is rapid, precise, simple and cost effective (only 1 pCR cost). Also described are oligonacleotide probes (AASO5227-AASO5242) for xx xx Sequence 208 BP; 44 A; 69 C; 69 G; 26 T; 0 other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               cc method. The method comprises obtaining a restriction fragment length CC polymorphism (RFLP) pattern of the 24 rpoB gene fragments; isolating, CC amplifying and digesting the DNA fragment from the microorganism to CC inflaments with the unidentified fragment. The rpoB gene fragments CC iragments with the unidentified fragment. The rpoB gene fragments CC are useful to identify a wide range of Mycobacterium species, e.g. for CC diagnosis or to obtain epidemiological and pathogenesis information for CC and non-tuberculous mycobacteria (NYM) encountered in subjects infected CC fragments is rapid, precise, simple and cost effective (only 1 PCR CC experiment, including those difficult to distinguish by usual biochemical CC tests. Also described are oligonucleotide probes (AASO5227-AASO5242) for XX
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Matches 187; Conserv

method. The method comprises obtaining a restriction fragment length CC polymorphism (RPLP) pattern of the 24 rpoB gene fragments; isolating, CC amplifying and digesting the DNA fragment from the microorganism to be identified and comparing the RPLP patterns from the microorganism to CC fragments with the unidentified fragment. The rpoB gene fragments CC are useful to identify a wide range of Mycobacterium species, e.g. for CC selection of appropriate therapies, including M. tuberculous mycobacteria (NTM) encountered in subjects information for CC and non-tuberculous mycobacteria (NTM) encountered in subjects infected fragments is rapid, precise, simple and cost effective (only 1 pCR CC required), and can differentiate between many species in a single CC tests. Also described are oligonuclectide probes (AAS05227-AAS05242) for XX

                                                                                                                                                                                                                                                                                     The present sequence for Mycobacterium ulcerans rpoB gene fragment is 1 of 24 rpoB gene fragments (AAS05201-AAS05224) from various Mycobacterial species. These rpoB gene fragments can be used in the diagnosis and identification of Mycobacterium species using a novel PCR-restriction fragment length polymorphism analysis (PRA)

                                                                                                                                                                                                                                                                                                                                                                                              The present sequence for Mycobacterium gordonae type I rpoB gene CC fragment is 1 of 24 rpoB gene fragments (AASO5201-AASO5224) from CC various Mycobacterial species. These rpoB gene fragments can be used in the diagnosis and identification of Mycobacterium species using a cc method. The method comprises obtaining a restriction fragment length polymorphism analysis (PRA) (CC polymorphism (RPLP) pattern of the 24 rpoB gene fragments; isolating, cc amplifying and digesting the DNA fragment from the microorganism to be identified and comparing the RPLP patterns from the known rpoB gene cragments with the unidentified fragment. The rpoB gene fragments comparing the RPLP patterns from the known rpoB gene gene useful to identify a wide range of Mycobacterium species, e.g. for cc selection of appropriate therapies, including M. tuberculosis, M. leprae with human immunodeficiency virus (HIV). Analysis of the rpoB gene cragments is rapid, precise, simple and cost effective (only 1 PCR crequired), and can differentiate between many species in a single cc experiment, including those difficult to distinguish by usual biochemical cc detecting specific Mycobacterial species (AASO5227-AASO5242) for xxx
                                                                                                                                                                                                                                                                                                                           Query Match

                                                                                                                                                                                                                  The present sequence for Mycobacterium gordonae type II rpoB gene CC fragment is 1 of 24 rpoB gene fragments (AASO5201-AASO5224) from CC various Mycobacterial species. These rpoB gene fragments can be used in the diagnosis and identification of Mycobacterium species using a CC method. The method comprises obtaining a restriction fragment length polymorphism analysis (PRA) CC polymorphism (RPLP) pattern of the 24 rpoB gene fragments; isolating, CC polymorphism and digesting the DNA fragment from the microorganism to CC amplifying and digesting the DNA fragment from the known rpoB gene identified and comparing the RPLP patterns from the known rpoB gene CC are useful to identify a wide range of Mycobacterium species, e.g. for CC diagnosis or to obtain epidemiological and pathogenesis information for CC selection of appropriate therapies, including M. tuberculosis, M. leprae with human immunodeficiency virus (HIV). Analysis of the rpoB gene CC required), and can differentiate between many species in a single CC tests. Also described are oligonucleotide probes (AASO5227-AASO5242) for XX

                                                                                       á
                                                                                                                                                                              The present sequence for Mycobacterium kansasii rpoB gene CC fragment is 1 of 24 rpoB gene fragments (AASO5201-AASO5224) from CC various Mycobacterial species. These rpoB gene fragments can be used in the diagnosis and identification of Mycobacterium species using a convel pcR-restriction fragment length polymorphism analysis (pRA) cc method. The method comprises obtaining a restriction fragment length cc polymorphism (RRLP) pattern of the 24 rpoB gene fragments; isolating, cc amplifying and digesting the DNA fragment from the known rpoB gene cc are useful to identify a wide range of Mycobacterium species, e.g. for cc diagnosis or to obtain epidemiological and pathogenesis information for and non-tuberculous mycobacteria (NTM) encountered in subjects infected fragments is rapid, precise, simple and cost effective (only 1 pcR crequired), and can differentiate between many species in a single cc estes. Also described are oligonucleotide probes (AASO5227-AASO5242) for xx

The present sequence for Mycobacterium celatum rpoB gene CC fragment is 1 of 24 rpoB gene fragments (AAS05221-AAS05224) from CC various Mycobacterial Species. These rpoB gene fragments can be used in the diagnosis and identification of Mycobacterium species using a method. The method comprises obtaining a restriction fragment length polymorphism analysis (PRA) cc method. The method comprises obtaining a restriction fragment length CC amplifying and digesting the DNA fragment from the microorganism to be identified and comparing the RFLP patterns from the known rpoB gene are useful to identify a wide range of Mycobacterium species, e.g. for CC diagnosis or to obtain epidemiological and pathogenesis information for Selection of appropriate therapies, including M. tuberculosis, M. leprae with human immunodeficiency virus (HTV). Analysis of the rpoB gene CC required), and can differentiate between many species in a single CC required, and can differentiate between many species in a single CC tests. Also described are oligonuclectide probes (AAS05227-AAS05242) for XX

                                        CC fragment is 1 of 24 rpoB gene fragments (AASOS201-AASOS224) from CC various Mycobacterial species. These rpoB gene fragments can be used CC in the diagnosis and identification of Mycobacterian species using a CC movel PCR-restriction fragment length polymorphism analysis (PRA) CC method. The method comprises obtaining a restriction fragment length CC polymorphism (RFLP) pattern of the 24 rpoB gene fragments; isolating, CC polymorphism (RFLP) pattern of the 24 rpoB gene fragments; isolating, CC amplifying and digesting the DNA fragment from the microorganism to CC diagnosis with the unidentified fragment. The rpoB gene fragments for CC are useful to identify a wide range of Mycobacterium species, e.g. for CC diagnosis or to obtain epidemiological and pathogenesis information for CC selection of appropriate therapies, including M. tuberculosis, M. leprae and non-tuberculous mycobacteria (MYM) encountered in subjects infected fragments is rapid, precise, simple and cost effective (only 1 PCR required), and can differentiate between many species in a single tests. Also described are oligonucleotide probes (AASOS227-AASOS242) for detecting specific Mycobacterial species.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Disclosure; Page 41; 50pp; English.

The present sequence for Mycobacterium terrae rpoB gene C fragment is 1 of 24 rpoB gene fragments (AAS05201-AAS05224) from CC various Mycobacterial Species. These rpoB gene fragments can be used in the diagnosis and identification of Mycobacterium species using a CC movel PCR-restriction fragment length polymorphism analysis (PRA) CC method. The method comprises obtaining a restriction fragment length CC polymorphism (RRILP) pattern of the 24 rpoB gene fragments; isolating, CC polymorphism (RRILP) pattern of the 24 rpoB gene fragments; isolating, CC polymorphism (RRILP) pattern of the 27 rpoB gene fragments; isolating, CC fragments with the unidentified fragment from the known rpoB gene CC are useful to identify a wide range of Mycobacterium species, e.g. for CC diagnosis or to obtain epidemiological and pathogenesis information for CC selection of appropriate therapies, including M. tuberculosis, M. leprae CC and non-tuberculous mycobacteria (NTM) encountered in subjects infected CC with human immunodeficiency virus (HIV). Analysis of the rpoB gene CC fragments is rapid, precise, simple and cost effective (only 1 pCR)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Q
